**Aspects need to be covered in the new application:**

1. The application should be in latest technology.
2. The application should be complete ERP i.e. true Enterprise Resource Planning with all modules integrated with each other with proper validations and there should not be any independent module kind of things. Financial Impact of each and every transaction has to be there.
3. Integration should be in proper way. You need to explain the complete process flow for the application along with integrations' effects.
4. The application should be capable to handle all operations in sugar factory:
  - a. Purchase
  - b. Inventory / Stores
  - c. Subcontracting
  - d. Manufacturing
  - e. Lab
  - f. Packaging & Stocking
  - g. Sales – Sugar & Others
  - h. Agriculture
  - i. Harvesting & Transportation
  - j. Weighbridge
  - k. Cane Accounting
5. The application should be able to integrate with mobile apps if required through APIs.
6. There should be a single Database Structure, not module wise databases. If it is having module wise separate databases, then it has to prove the inter-linking of transactions within separate databases. (e.g. PO-GRN-PURCHASE RETURN-PAYMENT-DEBIT NOTE-CREDIT NOTE LINKING)
7. The Application should be centralize and should be able to operate from any of the factory location (for any of the modules)
8. Browser based application would be preferred so that it can be hosted on cloud in future.
9. The service provider need to update the application regularly to cope-up with latest technologies being updated regularly and has to provide the updates free of cost if we will have AMC support. (Just as like SAP and Navision are providing).
10. If it will be under the AMC, no additional cost will be paid for any kind of platform updation or technology updation. The responsibility of such updation will be solely of the service provider.
1. The additional cost will be applicable only in case of any change request from our side i.e. change/addition in existing implemented business process.
2. The application must be operating in minimum man power of account department.
3. It should be user friendly & (MIS) Management information system must be effectively to access it.
